# Contents Volume 2

<b>Integrals and Geometry in <math>\mathbb{R}^n</math></b>	<b>427</b>
<hr/>	
<b>27 The Integral</b>	<b>429</b>
27.1 Primitive Functions and Integrals . . . . .	429
27.2 Primitive Function of $f(x) = x^m$ for $m = 0, 1, 2, \dots$ . . . . .	433
27.3 Primitive Function of $f(x) = x^m$ for $m = -2, -3, \dots$ . . . . .	434
27.4 Primitive Function of $f(x) = x^r$ for $r \neq -1$ . . . . .	434
27.5 A Quick Overview of the Progress So Far . . . . .	435
27.6 A “Very Quick Proof” of the Fundamental Theorem . . . . .	435
27.7 A “Quick Proof” of the Fundamental Theorem . . . . .	437
27.8 A Proof of the Fundamental Theorem of Calculus . . . . .	438
27.9 Comments on the Notation . . . . .	444
27.10 Alternative Computational Methods . . . . .	445
27.11 The Cyclist’s Speedometer . . . . .	445
27.12 Geometrical Interpretation of the Integral . . . . .	446
27.13 The Integral as a Limit of Riemann Sums . . . . .	448
27.14 An Analog Integrator . . . . .	449
<hr/>	
<b>28 Properties of the Integral</b>	<b>453</b>
28.1 Introduction . . . . .	453
28.2 Reversing the Order of Upper and Lower Limits . . . . .	454
28.3 The Whole Is Equal to the Sum of the Parts . . . . .	454

<b>28.4</b>	<u>Integrating Piecewise Lipschitz Continuous Functions</u>	455
<b>28.5</b>	<u>Linearity</u>	456
<b>28.6</b>	<u>Monotonicity</u>	457
<b>28.7</b>	<u>The Triangle Inequality for Integrals</u>	457
<b>28.8</b>	<u>Differentiation and Integration are Inverse Operations</u>	458
<b>28.9</b>	<u>Change of Variables or Substitution</u>	459
<b>28.10</b>	<u>Integration by Parts</u>	461
<b>28.11</b>	<u>The Mean Value Theorem</u>	462
<b>28.12</b>	<u>Monotone Functions and the Sign of the Derivative</u>	464
<b>28.13</b>	<u>A Function with Zero Derivative is Constant</u>	464
<b>28.14</b>	<u>A Bounded Derivative Implies Lipschitz Continuity</u>	465
<b>28.15</b>	<u>Taylor's Theorem</u>	465
<b>28.16</b>	<u>October 29, 1675</u>	468
<b>28.17</b>	<u>The Hodometer</u>	469
<b>29</b>	<b>The Logarithm <math>\log(x)</math></b>	473
<b>29.1</b>	<u>The Definition of <math>\log(x)</math></u>	473
<b>29.2</b>	<u>The Importance of the Logarithm</u>	474
<b>29.3</b>	<u>Important Properties of <math>\log(x)</math></u>	475
<b>30</b>	<b>Numerical Quadrature</b>	479
<b>30.1</b>	<u>Computing Integrals</u>	479
<b>30.2</b>	<u>The Integral as a Limit of Riemann Sums</u>	483
<b>30.3</b>	<u>The Midpoint Rule</u>	484
<b>30.4</b>	<u>Adaptive Quadrature</u>	485
<b>31</b>	<b>The Exponential Function <math>\exp(x) = e^x</math></b>	491
<b>31.1</b>	<u>Introduction</u>	491
<b>31.2</b>	<u>Construction of the Exponential <math>\exp(x)</math> for <math>x \geq 0</math></u>	493
<b>31.3</b>	<u>Extension of the Exponential <math>\exp(x)</math> to <math>x &lt; 0</math></u>	498
<b>31.4</b>	<u>The Exponential Function <math>\exp(x)</math> for <math>x \in \mathbb{R}</math></u>	498
<b>31.5</b>	<u>An Important Property of <math>\exp(x)</math></u>	499
<b>31.6</b>	<u>The Inverse of the Exponential is the Logarithm</u>	500
<b>31.7</b>	<u>The Function <math>a^x</math> with <math>a &gt; 0</math> and <math>x \in \mathbb{R}</math></u>	501
<b>32</b>	<b>Trigonometric Functions</b>	505
<b>32.1</b>	<u>The Defining Differential Equation</u>	505
<b>32.2</b>	<u>Trigonometric Identities</u>	509
<b>32.3</b>	<u>The Functions <math>\tan(x)</math> and <math>\cot(x)</math> and Their Derivatives</u>	510
<b>32.4</b>	<u>Inverses of Trigonometric Functions</u>	511
<b>32.5</b>	<u>The Functions <math>\sinh(x)</math> and <math>\cosh(x)</math></u>	513
<b>32.6</b>	<u>The Hanging Chain</u>	514
<b>32.7</b>	<u>Comparing <math>u'' + k^2 u(x) = 0</math> and <math>u'' - k^2 u(x) = 0</math></u>	515

<b>33 The Functions <math>\exp(z)</math>, <math>\log(z)</math>, <math>\sin(z)</math> and <math>\cos(z)</math> for <math>z \in \mathbb{C}</math></b>	<b>517</b>
33.1 Introduction . . . . .	517
33.2 Definition of $\exp(z)$ . . . . .	517
33.3 Definition of $\sin(z)$ and $\cos(z)$ . . . . .	518
33.4 de Moivres Formula . . . . .	518
33.5 Definition of $\log(z)$ . . . . .	519
<b>34 Techniques of Integration</b>	<b>521</b>
34.1 Introduction . . . . .	521
34.2 Rational Functions: The Simple Cases . . . . .	522
34.3 Rational Functions: Partial Fractions . . . . .	523
34.4 Products of Polynomial and Trigonometric or Exponential Functions . . . . .	528
34.5 Combinations of Trigonometric and Root Functions . .	528
34.6 Products of Exponential and Trigonometric Functions	529
34.7 Products of Polynomials and Logarithm Functions . .	529
<b>35 Solving Differential Equations Using the Exponential</b>	<b>531</b>
35.1 Introduction . . . . .	531
35.2 Generalization to $u'(x) = \lambda(x)u(x) + f(x)$ . . . . .	532
35.3 The Differential Equation $u''(x) - u(x) = 0$ . . . . .	536
35.4 The Differential Equation $\sum_{k=0}^n a_k D^k u(x) = 0$ . . . . .	537
35.5 The Differential Equation $\sum_{k=0}^n a_k D^k u(x) = f(x)$ . . . . .	538
35.6 Euler's Differential Equation . . . . .	539
<b>36 Improper Integrals</b>	<b>541</b>
36.1 Introduction . . . . .	541
36.2 Integrals Over Unbounded Intervals . . . . .	541
36.3 Integrals of Unbounded Functions . . . . .	543
<b>37 Series</b>	<b>547</b>
37.1 Introduction . . . . .	547
37.2 Definition of Convergent Infinite Series . . . . .	548
37.3 Positive Series . . . . .	549
37.4 Absolutely Convergent Series . . . . .	552
37.5 Alternating Series . . . . .	552
37.6 The Series $\sum_{i=1}^{\infty} \frac{1}{i}$ Theoretically Diverges! . . . . .	553
37.7 Abel . . . . .	555
37.8 Galois . . . . .	556
<b>38 Scalar Autonomous Initial Value Problems</b>	<b>559</b>
38.1 Introduction . . . . .	559
38.2 An Analytical Solution Formula . . . . .	560
38.3 Construction of the Solution . . . . .	563

<b>39 Separable Scalar Initial Value Problems</b>	<b>567</b>
39.1 Introduction . . . . .	567
39.2 An Analytical Solution Formula . . . . .	568
39.3 Volterra-Lotka's Predator-Prey Model . . . . .	570
39.4 A Generalization . . . . .	571
<b>40 The General Initial Value Problem</b>	<b>575</b>
40.1 Introduction . . . . .	575
40.2 Determinism and Materialism . . . . .	577
40.3 Predictability and Computability . . . . .	577
40.4 Construction of the Solution . . . . .	579
40.5 Computational Work . . . . .	580
40.6 Extension to Second Order Initial Value Problems . . . . .	581
40.7 Numerical Methods . . . . .	582
<b>41 Calculus Tool Bag I</b>	<b>585</b>
41.1 Introduction . . . . .	585
41.2 Rational Numbers . . . . .	585
41.3 Real Numbers. Sequences and Limits . . . . .	586
41.4 Polynomials and Rational Functions . . . . .	586
41.5 Lipschitz Continuity . . . . .	587
41.6 Derivatives . . . . .	587
41.7 Differentiation Rules . . . . .	587
41.8 Solving $f(x) = 0$ with $f : \mathbb{R} \rightarrow \mathbb{R}$ . . . . .	588
41.9 Integrals . . . . .	589
41.10 The Logarithm . . . . .	590
41.11 The Exponential . . . . .	591
41.12 The Trigonometric Functions . . . . .	591
41.13 List of Primitive Functions . . . . .	594
41.14 Series . . . . .	594
41.15 The Differential Equation $u + \lambda(x)u(x) = f(x)$ . . . . .	595
41.16 Separable Scalar Initial Value Problems . . . . .	595
<b>42 Analytic Geometry in <math>\mathbb{R}^n</math></b>	<b>597</b>
42.1 Introduction and Survey of Basic Objectives . . . . .	597
42.2 Body/Soul and Artificial Intelligence . . . . .	600
42.3 The Vector Space Structure of $\mathbb{R}^n$ . . . . .	600
42.4 The Scalar Product and Orthogonality . . . . .	601
42.5 Cauchy's Inequality . . . . .	602
42.6 The Linear Combinations of a Set of Vectors . . . . .	603
42.7 The Standard Basis . . . . .	604
42.8 Linear Independence . . . . .	605
42.9 Reducing a Set of Vectors to Get a Basis . . . . .	606
42.10 Using Column Echelon Form to Obtain a Basis . . . . .	607
42.11 Using Column Echelon Form to Obtain $R(A)$ . . . . .	608

## Integrals and Geometry in $\mathbb{R}^n$

$$\begin{aligned} u(x_N) - u(x_0) &= \int_{x_0}^{x_N} u'(x) dx \\ &\approx \sum_{j=1}^N u'(x_{j-1})(x_j - x_{j-1}) \end{aligned}$$

$$a \cdot b = a_1 b_1 + a_2 b_2 + \cdots + a_n b_n$$

A familiar example of this problem occurs when  $f(x)$  is a velocity and  $x$  represents time so that the solution  $u(x)$  of  $u'(x) = f(x)$ , represents the distance traveled by a body moving with instantaneous velocity  $u'(x) = f(x)$ . As the examples above show, we can solve this problem in simple cases, for example when the velocity  $f(x)$  is equal to a constant  $v$  for all  $x$  and therefore the distance traveled during a time  $x$  is  $u(x) = vx$ . If we travel with constant velocity 4 miles/hour for two hours, then the distance traveled is 8 miles. We reach these 8 miles by accumulating distance foot-by-foot, which would be very apparent if we are walking!

An important observation is that the differential equation (27.1) alone is not sufficient information to determine the solution  $u(x)$ . Consider the interpretation when  $f$  represents velocity and  $u$  distance traveled by a body. If we want to know the position of the body, we need to know only the distance traveled but also the starting position. In general, a solution  $u(x)$  to (27.1) is determined only up to a constant, because the derivative of a constant is zero. If  $u'(x) = f(x)$ , then also  $(u(x) + c)' = f(x)$  for any constant  $c$ . For example, both  $u(x) = x^2$  and  $u(x) = x^2 + 1$  satisfy  $u'(x) = 2x$ . Graphically, we can see that there are many “parallel” functions that have the same slope at every point. The constant may be specified by specifying the value of the function  $u(x)$  at some point. For example, the solution of  $u'(x) = x$  is  $u(x) = x^2 + c$  with  $c$  a constant, and specifying  $u(0) = 1$  gives that  $c = 1$ .

**Fig. 27.2.** Two functions that have the same slope at every point

More generally, we now formulate our basic problem as follows: Given  $f : [a, b] \rightarrow \mathbb{R}$  and  $u_a$ , find  $u : [a, b] \rightarrow \mathbb{R}$  such that

$$\begin{cases} u'(x) = f(x) & \text{for } a < x \leq b, \\ u(a) = u_a, \end{cases} \quad (27.2)$$

where  $u_a$  is a given *initial value*. The problem (27.2) is the simplest example of an *initial value problem* involving a differential equation and an initial value. The terminology naturally couples to situations in which  $x$  represents time and  $u(a) = u_a$  amounts to specifying  $u(x)$  at the initial time  $x = a$ . Note that we often keep the initial value terminology even if  $x$  represents a quantity different from time, and in case  $x$  represents a space coordinate we may alternatively refer to (27.2) as a *boundary value problem* with now  $u(a) = u_a$  representing a given *boundary value*.

We shall now prove that the initial value problem (27.2) has a unique solution  $u(x)$  if the given function  $f(x)$  is Lipschitz continuous on  $[a, b]$ . This is the *Fundamental Theorem of Calculus*, which stated in words says that a Lipschitz continuous function has a (unique) primitive function. Leibniz referred to the Fundamental Theorem as the “inverse method of tangents” because he thought of the problem as trying to find a curve  $y = u(x)$  given the slope  $u'(x)$  of its tangent at every point  $x$ .

We shall give a constructive proof of the Fundamental Theorem, which not only proves that  $u : I \rightarrow \mathbb{R}$  exists, but also gives a way to compute  $u(x)$  for any given  $x \in [a, b]$  to any desired accuracy by computing a sum involving values of  $f(x)$ . Thus the version of the Fundamental Theorem we prove contains two results: (i) the existence of a primitive function and (ii) a way to compute a primitive function. Of course, (i) is really a consequence of (ii) since if we know how to compute a primitive function, we also know that it exists. These results are analogous to defining  $\sqrt{2}$  by constructing a Cauchy sequence of approximate solutions of the equation  $x^2 = 2$  by the Bisection algorithm. In the proof of the Fundamental Theorem we shall also construct a Cauchy sequence of approximate solutions of the differential equation (27.2) and show that the limit of the sequence is an exact solution of (27.2).

We shall express the solution  $u(x)$  of (27.2) given by the Fundamental Theorem in terms of the data  $f(x)$  and  $u_a$  as follows:

$$u(x) = \int_a^x f(y) dy + u_a \quad \text{for } a \leq x \leq b, \quad (27.3)$$

where we refer to

$$\int_a^x f(y) dy$$

as the *integral* of  $f$  over the interval  $[a, x]$ ,  $a$  and  $x$  as the *lower and upper limits of integration* respectively,  $f(y)$  as the *integrand* and  $y$  the *integration variable*. This notation was introduced on October 29 1675 by Leibniz, who thought of the integral sign  $\int$  as representing “summation” and  $dy$  as the “increment” in the variable  $y$ . The notation of Leibniz is part of the big success of Calculus in science and education, and (like a good cover of a record) it gives a direct visual expression of the mathematical content of the integral in very suggestive form that indicates both the construction of

## 27.5 A Quick Overview of the Progress So Far

Any function obtained by linear combinations, products, quotients and compositions of functions of the form  $x^r$  with rational power  $r \neq 0$  and  $x > 0$ , can be differentiated analytically. If  $u(x)$  is such a function, we thus obtain an analytical formula for  $u'(x)$ . If we now choose  $f(x) = u'(x)$ , then of course  $u(x)$  satisfies the differential equation  $u'(x) = f(x)$ , so that we can write recalling Leibniz notation:

$$u(x) = \int_0^x f(y) dy + u(0) \quad \text{for } x \geq 0,$$

which apparently states that the function  $u(x)$  is a primitive function of its derivative  $f(x) = u'(x)$  (assuming that  $u(x)$  is defined for all  $x \geq 0$  so that no denominator vanishes for  $x \geq 0$ ).

We give an example: Since  $D(1+x^3)^{\frac{1}{3}} = (1+x^3)^{-\frac{2}{3}}x^2$  for  $x \in \mathbb{R}$ , we can write

$$(1+x^3)^{\frac{1}{3}} = \int_0^x \frac{y^2}{(1+y^3)^{\frac{2}{3}}} dy + 1 \quad \text{for } x \in \mathbb{R}.$$

In other words, we know primitive functions  $u(x)$  satisfying the differential equation  $u'(x) = f(x)$  for  $x \in I$ , for any function  $f(x)$ , which itself is a derivative of some function  $v(x)$  so that  $f(x) = v'(x)$  for  $x \in I$ . The relation between  $u(x)$  and  $v(x)$  is then

$$u(x) = v(x) + c \quad \text{for } x \in I,$$

for some constant  $c$ .

On the other hand, if  $f(x)$  is an arbitrary function of another from, then we may not be able to produce an analytical formula for the corresponding primitive function  $u(x)$  very easily or not at all. The Fundamental Theorem now tells us how to compute a primitive function of an arbitrary Lipschitz continuous function  $f(x)$ . We shall see that in particular, the function  $f(x) = x^{-1}$  has a primitive function for  $x > 0$  which is the famous *logarithm function*  $\log(x)$ . The Fundamental Theorem therefore gives in particular a constructive procedure for computing  $\log(x)$  for  $x > 0$ .

## 27.6 A “Very Quick Proof” of the Fundamental Theorem

We shall now enter into the proof of the Fundamental Theorem. It is a good idea at this point to review the Chapter *A very short course in Calculus*. We shall give a sequence of successively more complete versions of the proof of the Fundamental Theorem with increasing precision and generality in each step.
